

the simple and stable flat roof mounting system!

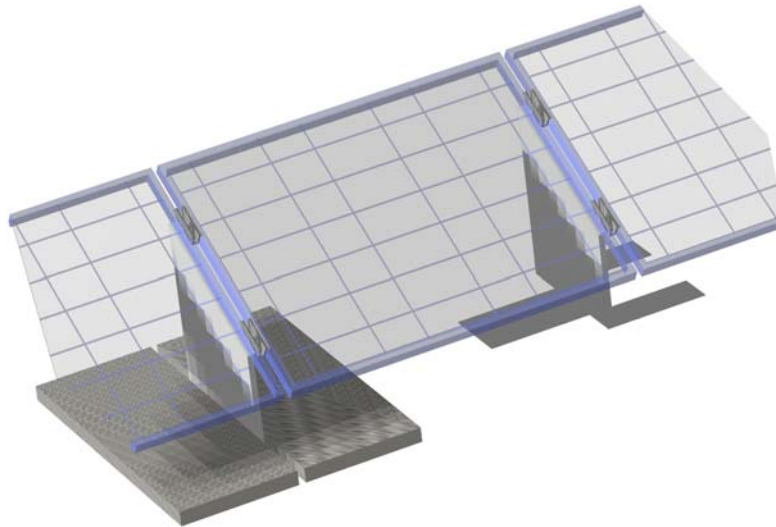

- **Inexpensive, fast and flexible mounting**
- **Stiff and temperature resistant**
- **Durable**
- **Best rear-ventilation guarantees very high yields**
- **10 year guarantee – just as on all Schletter systems**

Quality and high yields are the things that count in the hard-fought market for photovoltaic solar power plants. For many years Schletter has been offering **high quality PV mounting systems** and is therefore often setting new standards on the market. For high quality modules PrimaTop is an absolutely fast and save mounting possibility. Best rear-ventilation guarantees very high yields.

Mounting

Schletter Prima Top is especially suitable for the cross mounting of modules on flat roofs if you plan a system with weighed supports. The consoles are positioned in the right distances. A protection mat should be put under every support. Most suitable for the loading are paving stones or similar concrete blocks. The supports are folded and welded to guarantee a sufficient stability. The modules are simply clamped to the supports which contributes to best rear-ventilation. Thermic deformation or heating of the modules are prevented. The supports are equipped with nicks for the wiring. The distance to the ground is so high that the slipping of snow is possible.

Material	Aluminium or VA steel
Statics	DIN 1055 new, Eurocode 1 System statics with specifications about the necessary loading depending on the module size. Please also note application hints for Prima Top support!
Calculation and ordering	for example with our auto calculator software
Module sizes	recommended for module sizes up to app. 0,8 x 1,6m

Important hints:

- **PrimaTop is only suitable for modules that may be spanned freely over the total module height – please don't forget to check the module features!**
- **To prevent them from slipping off the base plate the stones on both sides of the support should be durably connected. Please also read the application hints!**
